

CS 443 Hash-based Indexes Chapter 11

Slides adapted from Ramakrishnan & Gerhke pages.cs.wisc.edu/~dbbook

Renée J. Miller

Introduction

2

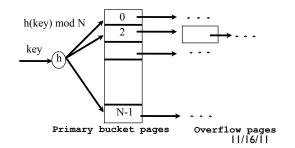

- □ As for any index, 3 alternatives for data entries k*:
 - I. Data record with key value k
 - 2. <k, rid of data record with search key value k>
 - 3. <k, list of rids of data records with search key k>
 - □ Choice orthogonal to the indexing technique
- Hash-based indexes are best for equality selections.
 Cannot support range searches.
- □ Static and dynamic hashing techniques exist; tradeoffs similar to ISAM vs. B+ trees.

11/16/11

Static Hashing

- * # primary pages fixed, allocated sequentially, never de-allocated; overflow pages if needed.
- ❖ h(k) mod M = bucket to which data entry with key k belongs. (M = # of buckets)

Static Hashing (Contd.)

- ❖ Buckets contain data entries.
- ❖ Hash fn works on search key field of record r. Must distribute values over range 0 ... M-1.
 - e.g., $h(key) = (a * key + b) \mod M$
 - a and b are constants; lots known about how to tune h.
- Long overflow chains can develop and degrade performance.
 - Extendible and Linear Hashing: Dynamic techniques to fix this problem.

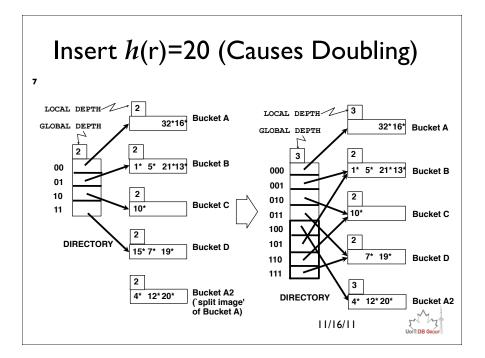

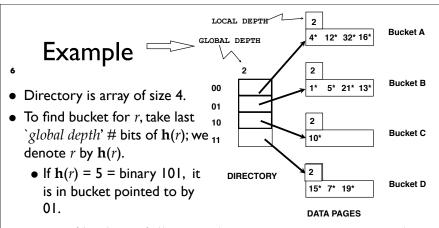

Extendible Hashing

- Situation: Bucket (primary page) becomes full. Why not re-organize file by doubling # of buckets?
 - Reading and writing all pages is expensive!
 - <u>Idea</u>: Use <u>directory of pointers to buckets</u>, double # of buckets by <u>doubling the directory</u>, splitting just the bucket that overflowed!
 - Directory much smaller than file, so doubling it is much cheaper. Only one page of data entries is split. No overflow page!
 - Trick lies in how hash function is adjusted!

11/16/11

- * <u>Insert</u>: If bucket is full, <u>split</u> it (allocate new page, re-distribute).
- * *If necessary*, double the directory. (As we will see, splitting a bucket does not always require doubling; we can tell by comparing *global depth* with *local depth* for the split bucket.)

11/16/11

Points to Note

- * 20 = binary 10100. Last 2 bits (00) tell us r belongs in A or A2. Last $\underline{3}$ bits needed to tell which.
 - Global depth of directory: Max # of bits needed to tell which bucket an entry belongs to.
 - Local depth of a bucket: # of bits used to determine if an entry belongs to this bucket.
- When does bucket split cause directory doubling?
 - Before insert, local depth of bucket = global depth. Insert causes local depth to become > global depth; directory is doubled by copying it over and `fixing' pointer to split image page. (Use of least significant bits enables efficient doubling via copying of directory!)

Comments: Extendible Hashing

- ❖ If directory fits in memory, equality search answered with one disk access; else two.
 - 100MB file, 100 bytes/rec, 4K pages contains 1,000,000 records (as data entries) and 25,000 directory elements; chances are high that directory will fit in memory.
 - Directory grows in spurts, and, if the distribution of hash values is skewed, directory can grow large.
 - Multiple entries with same hash value cause problems!
- * <u>Delete</u>: If removal of data entry makes bucket empty, can be merged with `split image'. If each directory element points to same bucket as its split image, can halve directory.

Linear Hashing

П

- Directory avoided in LH by using overflow pages, and choosing bucket to split round-robin.
 - Splitting proceeds in `rounds'. Round ends when all N_R initial (for round R) buckets are split. Buckets 0 to Next-1 have been split; Next to N_R yet to be split.
 - Current round number is *Level*.
 - <u>Search</u>: To find bucket for data entry r, find $\mathbf{h}_{Level}(r)$:
 - If $\mathbf{h}_{Level}(\mathbf{r})$ in range `Next to N_R ', \mathbf{r} belongs here.
 - Else, r could belong to bucket $\mathbf{h}_{I,onel}(r)$ or bucket $\mathbf{h}_{I,onel}(r)$
 - + N_R ; must apply $\mathbf{h}_{Level+1}(r)$ to find out.

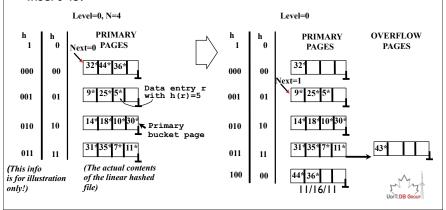

11/16/11

Example of Linear Hashing

10

- ❖ On split, h_{l evel+1} is used to re-distribute entries.
- Insert 43.

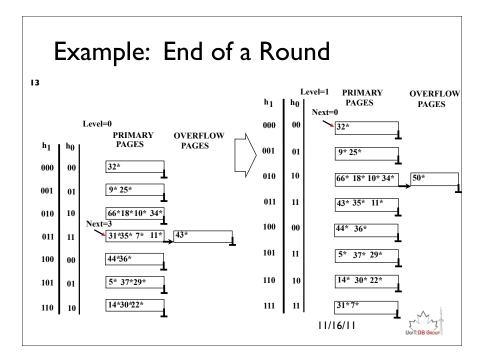

Linear Hashing (Contd.)

12

- ❖ <u>Insert</u>: Find bucket by applying $\mathbf{h}_{Level+1}$:
 - If bucket to insert into is full:
 - Add overflow page and insert data entry.
 - (Maybe) Split Next bucket and increment Next.
- Can choose any criterion to `trigger' split.
- Since buckets are split round-robin, long overflow chains don't develop!
- Doubling of directory in Extendible Hashing is similar; switching of hash functions is *implicit* in how the # of bits examined is increased.

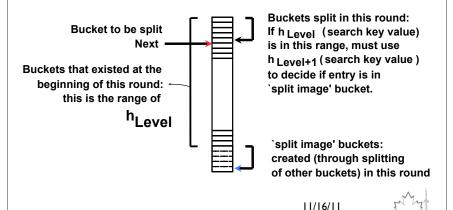

11/16/11

Overview of LH File

❖ In the middle of a round.

14

LH Described as a Variant of EH

- * The two schemes are actually quite similar:
 - $\, \bullet \,$ Begin with an EH index where directory has N elements.
 - Use overflow pages, split buckets round-robin.
 - First split is at bucket 0. (Imagine directory being doubled at this point.) But elements <1,N+1>, <2,N+2>, ... are the same. So, need only create directory element N, which differs from 0, now.
 - \bullet When bucket I splits, create directory element N+I , etc.
- * So, directory can double gradually. Also, primary bucket pages are created in order. If they are *allocated* in sequence too (so that finding i'th is easy), we actually don't need a directory! Voila, LH.

Summary

- Hash-based indexes: best for equality searches, cannot support range searches.
- * Static Hashing can lead to long overflow chains.
- * Extendible Hashing avoids overflow pages by splitting a full bucket when a new data entry is to be added to it.
 - * Directory to keep track of buckets, doubles periodically.
 - Can get large with skewed data; additional I/O if this does not fit in main memory.

Summary (Contd.)

17

- Linear Hashing avoids directory by splitting buckets round-robin, and using overflow pages.
 - Overflow pages not likely to be long.
 - Space utilization could be lower than Extendible Hashing, since splits not concentrated on `dense' data areas.
 - Can tune criterion for triggering splits to trade-off slightly longer chains for better space utilization.
- * For hash-based indexes, a *skewed* data distribution is one in which the *hash values* of data entries are not uniformly distributed!
